

**Medical Alert - Bleomycin Therapy**

I have previously received Bleomycin therapy

High concentration oxygen may cause severe lung damage

Caution should be exercised with oxygen administration but  
should **not** be denied if needed

If oxygen is required, the lowest oxygen flow that maintains  
adequate tissue oxygenation should be provided.

If a general anaesthetic is needed for an operation, please  
discuss your past Bleomycin treatment with the medical team /  
anaesthetist

Recreational use of high flow oxygen (e.g. in scuba diving) is not  
advised.

Use of recreational oxygen products as a recreational drug or  
wellness product is not advised.

Risk persists possibly lifelong after Bleomycin treatment
